Background

Hydrogen peroxide, \( \text{H}_2\text{O}_2 \) is one of the most frequently occurring reactive oxygen species. It is formed either in the environment or as a by-product of aerobic metabolism, superoxide formation and dismutation, or as a product of oxidase activity. Both excessive hydrogen peroxide and its decomposition product hydroxyl radical, formed in a Fenton-type reaction, are harmful for most cell components. Its rapid removal is essential for all aerobically living prokaryotic and eukaryotic cells\(^1\)\(^2\). Hydrogen peroxide however can act as a second messenger in signal transduction pathways, in immune cell activation, inflammation processes, cell proliferation, and apoptosis\(^3\)\(^-\)\(^5\).

Catalase Reaction

\[
2 \text{H}_2\text{O}_2 \xrightarrow{\text{Catalase}} \text{H}_2\text{O} + \text{O}_2
\]

One of the most efficient ways of removing peroxide is through the enzyme catalase, which is encoded by a single gene, and is highly conserved among species\(^6\)\(^-\)\(^8\). Mammals, including humans and mice, express catalase in all tissues, and a high concentration of catalase can be found in the liver, kidneys and erythrocytes\(^9\)\(^,\)\(^10\). The expression is regulated at transcription, post-transcription and post-translation levels\(^6\),\(^11\). High catalase activity is detected in peroxisomes\(^12\). More recently, short wavelength UV radiation has been shown to produce reactive oxygen species (ROS) through the action of catalase\(^13\). This response is thought to act as a mechanism to protect DNA by converting damaging UV radiation into ROS species that can be metabolized and detoxified by cellular antioxidant enzymes.

The DetectX® Catalase Activity Kit is designed to quantitatively measure catalase activity in a variety of samples. Please read the complete kit insert before performing this assay. A bovine catalase standard is provided to generate a standard curve for the assay and all samples should be read off of the standard curve. Samples are diluted in the provided Assay Buffer and added to the wells of a half area black plate. Hydrogen peroxide is added to each well and the plate incubated at room temperature for 30 minutes. The supplied Fluorescent Detection Reagent is added, followed by diluted horseradish peroxidase and incubated at room temperature for 15 minutes. The HRP reacts with the substrate in the presence of hydrogen peroxide to convert the colorless substrate into a fluorescent product. The fluorescent product is read at 590 nm with excitation at 570 nm. Increasing levels of catalase in the samples causes a decrease in H$_2$O$_2$ concentration and a reduction in fluorescent product. The activity of the catalase in the sample is calculated after making a suitable correction for any dilution, using software available with most plate readers. The results are expressed in terms of units of catalase activity per mL.

SUPPLIED COMPONENTS

Black 96 well Half Area Plates
2 Plates  Catalog Number X037-2EA

Catalase Standard
90 µL  Catalog Number C114-90UL
100 Unit/mL of bovine catalase in a special solution.

Assay Buffer Concentrate
25 mL  Catalog Number X106-25ML
A 5X buffer concentrate containing detergents and stabilizers.

Hydrogen Peroxide Reagent
5 mL  Catalog Number C115-5ML
Hydrogen peroxide solution containing stabilizers.

Fluorescent Detection Reagent
5 mL  Catalog Number C116-5ML
A solution of the substrate in a special stabilizing buffer.

Horseradish Peroxidase Concentrate
60 µL  Catalog Number X107-60UL
A 100X concentrated solution of HRP in a special stabilizing solution.

STORAGE INSTRUCTIONS

All components of this kit should be stored at 4°C until the expiration date of the kit.
**Other Materials Required**

Repeater pipet with disposable tips capable of dispensing 25 µL.

Software for converting fluorescent intensity readings from the plate reader and carrying out four parameter logistic curve (4PLC) fitting. Contact your plate reader manufacturer for details.

**Precautions**

As with all such products, this kit should only be used by qualified personnel who have had laboratory safety instruction. The complete insert should be read and understood before attempting to use the product.

The supplied hydrogen peroxide solution contains very dilute H₂O₂.

**Sample Types and Preparation**

Samples that need to be stored after collection should be stored at -70°C or lower, preferably after being frozen in liquid nitrogen. This assay has been validated for serum, plasma and erythrocyte lysates. Samples containing visible particulate should be centrifuged prior to using.

Process any cell pellet as described for Cell Lysates on page 7.
Sample Preparation

Cell Suspensions and Adherent Cells
1. Centrifuge > 1 x 10^6 cells in suspension at 250 x g for 10 minutes at 4°C. Discard the supernatant. Adherent cells should be gently dislodged using a rubber policeman - do not use proteolytic enzymes.
2. Homogenize or sonicate the pellet in 1-2 mL of cold Assay Buffer per 100 mg of cells. Centrifuge at 10,000 x g for 15 minutes at 4°C.
3. Collect the supernatant and assay immediately, or store at ≤-70°C. Dilute in Assay Buffer prior to measuring catalase activity.

Tissue Samples
1. Wash tissue thoroughly with ice cold PBS prior to processing to remove any red blood cells or clots.
2. Homogenize or sonicate the tissue in 0.5-1 mL of cold Assay Buffer per 100 mg of tissue. Centrifuge at 10,000 x g for 15 minutes at 4°C.
3. Collect the supernatant and assay immediately, or store at ≤-70°C. Dilute in Assay Buffer prior to measuring catalase activity.

Serum Samples
1. Collect serum in tubes without anticoagulant. Allow to clot for 30 minutes at room temperature. Centrifuge the sample at 2,000 x g for 15 minutes at 4°C. Aspirate off the pale yellow serum without disturbing the white buffy layer.
2. Assay immediately or freeze at ≤-70°C.
3. Serum should be diluted at least 1:5 by taking one part of serum and adding 4 parts of Assay Buffer prior to assaying. Further dilutions in Assay Buffer may be needed.

Plasma and RBC/Erythrocytes
1. Collect plasma in tubes with EDTA or heparin anticoagulant.
2. Centrifuge at 700-1,000 x g for 10 minutes at 4°C. Aspirate off the pale yellow plasma without disturbing the white buffy layer.
3. Remove the white buffy layer and discard.
4. Erythrocytes can be lysed by taking the pelleted RBCs and adding 4 volumes of ice cold deionized water.
5. Centrifuge at 10,000 x g for 15 minutes at 4°C to remove debris.
6. Collect the supernatant and assay immediately, or store at ≤-70°C. Dilute in Assay Buffer ≥1:10 prior to measuring catalase activity.
Allow the kit reagents to come to room temperature for 30-60 minutes. We recommend that all standards and samples be run in duplicate to allow the end user to accurately determine Catalase activities. Ensure that all samples have reached room temperature and have been diluted as appropriate prior to running them in the kit.

**Assay Buffer**

Dilute Assay Buffer Concentrate 1:5 by adding one part of the concentrate to four parts of deionized water. Once diluted this is stable at 4°C for 3 months.

**Standard Preparation**

Standards are prepared by labeling six tubes as #1 through #6. Add 190 µL of Assay Buffer to tube #1. Pipet 100 µL of Assay Buffer into tubes #2 to #6. Carefully add 10 µL of the Catalase Stock from the vial to tube #1 and vortex completely. Take 100 µL of the catalase solution in tube #1 and add it to tube #2 and vortex completely. Repeat the serial dilutions for tubes #3 through #6. The catalase activity in tubes 1 through 6 will be 5, 2.5, 1.25, 0.625, 0.313 and 0.1563 U/mL.

*Use all Standards within 2 hours of preparation.*

The HRP Preparation will be stable for one day.
Use the plate layout sheet on the back page to aid in proper sample and standard identification. Set plate parameters for a 96-well Corning Costar 3694 plate.

1. Pipet 25 µL of samples or appropriate standards into duplicate wells in the plate.
2. Pipet 25 µL of Assay Buffer into duplicate wells as the Zero standard.
3. Add 25 µL of the supplied Hydrogen Peroxide Reagent to each well using a repeater pipet.
4. Incubate at room temperature for 30 minutes.
5. Add 25 µL of the supplied Fluorescent Detection Reagent to each well using a repeater pipet.
6. Initiate the reaction by adding 25 µL of the prepared HRP Reagent to each well using a repeater pipet.
7. Incubate at room temperature for 15 minutes.
8. Set plate parameters for a 96-well Corning Costar 3694 plate. See: http://www.ArborAssays.com/resources/lit.asp for plate dimension data. Read the fluorescent emission at 585 ± 5 nm with excitation at 575 ± 5 nm. Please contact your plate reader manufacturer for suitable filter sets.
Average the duplicate FLU readings for each standard and sample. Create a standard curve by reducing the data using the 4PLC fitting routine on the plate reader. The sample activity obtained should be multiplied by the dilution factor to obtain neat sample values.

Or use the online tool from www.myassays.com/arbor-assays-catalase-fluorescent-activity-kit assay to calculate the data.

Always run your own standard curves for calculation of results. Do not use these data.

**Catalase Unit Definition**

One Unit of Catalase decomposes one micromole of \( \text{H}_2\text{O}_2 \) per minute at 25°C and pH 7.0.
Always run your own standard curves for calculation of results. Do not use these data.

**VALIDATION DATA**

**Sensitivity**
Sensitivity was calculated by comparing the FLUs for twenty wells run for each of the zero and standard #6. The detection limit was determined at two (2) standard deviations from the zero along the standard curve.
**Sensitivity was determined as 0.073 U/mL. This is equivalent to 1.83 mU/well.**

**Limit of Detection**
The Limit of Detection for the assay was determined in a similar manner by comparing the FLU's for twenty runs for each of the zero standard and a low concentration human sample.
**Limit of Detection was determined as 0.112 U/mL. This is equivalent to 2.80 mU/well.**
**Linearity**

Linearity was determined by taking two samples, one with a high known catalase activity of 3.74 U/mL and the other with a lower catalase activity of 0.90 U/mL and mixing them in the ratios given below. The measured activities were compared to the expected values based on the ratios used.
